

Looking for a way to reduce travel costs? Need to make a cross-functional decision immediately, even though your colleagues are scattered across the world? Have to plan a conference call for literally thousands of participants?

Vail Conferencing.
The perfect way to
conduct your
meeting.

Vail Conferencing combines cost-effective, high-quality service with innovative features like "always available" standing bridges, custom music-on-hold, email conference reminders and summaries, and convenient web-based control. With Vail Conferencing, your company will benefit from:

Superior Voice Quality ■

Pure digital conferencing provides the best voice quality possible. Each voice stream of a call is digitally mixed to shape conversations naturally, even when multiple parties are talking. In addition, Vail has developed a series of algorithms that measure voice energy and background noise on each leg of a conference call. As a result, unlike other conferencing products, users' voices aren't clipped due to pauses, starts and interruptions that happen in normal conversations, nor do they have to compete with noise from other legs. The application automatically adjusts signal/noise sensitivity levels to ensure optimum clarity.

Flexible Options: Scheduled Conferences, Broadcast and Standing Bridges ■

Entirely software-based, Vail Conferencing can be configured in many different ways including standard conference calls, scheduled broadcast calls and standing bridges, where customers have a fixed "always available" conference number. No more need for scheduling. No more numbers to remember. The total number of participants per conference is also highly scalable, from only a few to thousands for broadcast calls.

Total Control ■

Experience the perfect balance between functionality and usability. Conference call control is completely configured and managed through a secure website. As a conference host, you can watch your conference in real-time and add, drop or mute parties on-the-fly. Other often over-looked aspects of a conference call are also entirely user-defined, such as the type of chime heard when a party joins and the music participants hear while waiting for a host to arrive. Don't want to require a host? That's configurable too.

About Vail Systems

Vail Systems develops and hosts compelling speech-enabled IVR solutions that reduce costs, improve workforce productivity, and drive new revenues. Our carrier-grade SIP VoIP platform automates millions of calls per month for a wide range of applications including: enterprise call routing, speech locator, name/address change, outbound notification, and conferencing.
